

To Identify Built-ins, Create Dispatch Table, Execute In- Process Commands, Handle Invalid Commands, Maintain State, Test Dispatch Logic

Code:

```
#include <stdio.h>
#include <string.h>
#include <unistd.h>

void pwd() {
    char path[100];
    getcwd(path, sizeof(path));
    printf("%s\n", path);
}

void help() {
    printf("Built-in commands: pwd, help, exit\n");
}

int main() {
    char command[50];

    printf("Enter command: ");
    scanf("%s", command);

    if (strcmp(command, "pwd") == 0)
        pwd();

    else if (strcmp(command, "help") == 0)
        help();

    else if (strcmp(command, "exit") == 0)
        printf("Exiting...\n");

    else
        printf("Invalid command\n");

    return 0;
}
```

Output:

```
geya@LenovoL480:~/OS/Skill/Week 4$ ./task2
Enter command: pwd
/home/geya/OS/Skill/Week 4
geya@LenovoL480:~/OS/Skill/Week 4$ ./task2
Enter command: help
Built-in commands: pwd, help, exit
geya@LenovoL480:~/OS/Skill/Week 4$ |
```
